

P.moon Poly Converters

Version 2025-01-28

P to M converts a poly signal to 16 mono signals.

M to P collects 16 mono signals to one poly signal.

Both modules are equipped with a “!” marked **“Master”** mono input connector. When a cable is connected to that input jack, it’s CV will be sent to output jacks instead of eventually received input signals.

Depending on actual polyphony, areas around inactive jacks are dark gray.

Normally active jacks are placed on light gray areas.

In “Master” mode rectangles of “!” jack and active channels get yellow colored.
