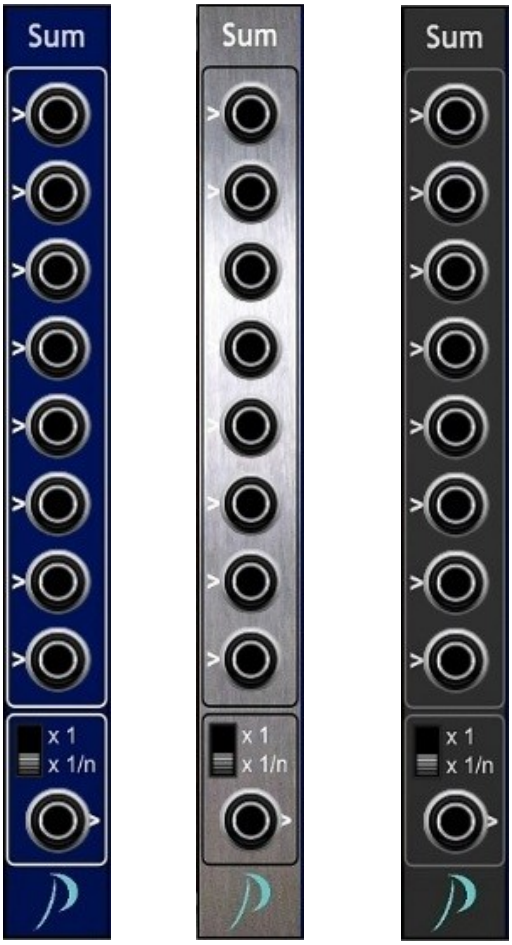
Sum

Version 2024-02-20



Sum is a simple signal mixer without controls.

Two modes are selectable:

x 1	Total sum of input signals is sent to output.
x 1/n	Signals are added and then divided by number of connected inputs before sent to output.

This module comes with three select-able skins. A skin change forces skin change of all other **P.moon** modules on your computer that allow skin selection.

When the mouse cursor moves on the area of the P.moon logo, a red frame appears.

A right click on the logo opens the skin menu. The actual skin name is marked with a hook. If you click on another skin name with left mouse button, that skin will be loaded for this module and for all other Master Control modules on your computer. A left click to anywhere else closes the menu without changing the skin.
